Contents

1 Introduction **1**

1.1 Aim and Scope 2

1.2 Organization 4

2 Fundamentals **6**

2.1 Frequency-Adaptive Simulation of Transients 6

2.1.1 Companion Model for Instantaneous Signals 7

2.1.2 Processing of Analytic Signals 8

2.1.3 Companion Model for Multi-Scale Simulation 10

2.2 Modeling of Short-Circuit Faults in Transients Simulation 12

2.3 Multi-Scale Modeling of Transmission Lines 13

2.3.1 Constant Distributed Parameter Transmission Line Model 14

2.3.2 Modal-Domain Frequency-Dependent Transmission Line Model 16

2.4 Fundamentals of State-Space Method 17

2.5 Review of PMSG-Based Wind Energy Conversion System 18

2.6 Summary 19

3 Modeling of Short-Circuit Faults in Multi-Scale Simulation **21**

3.1 Introduction 21

3.2 Modeling of Short-Circuit Faults in Multi-Scale Simulation 23

3.2.1 Explanation of Algorithm 23

3.2.2 Application on Different Types of Short-Circuit Faults 26

3.3 Interpolation and Extrapolation with Analytic Signals 26

3.3.1 Interpolation with Analytic Signals . . . 27
3.3.2 Extrapolation with Analytic Signals . . . 28
3.4 Test Simulations . . . 28
3.4.1 Four-Machine Two-Area System . . . 29
3.4.2 IEEE 39-Bus System . . . 34
3.5 Conclusions . . . 38

4 Multi-Scale Modeling of Transmission Line for Integrative Simulation of Networks 39
4.1 Introduction . . . 39
4.2 Multi-Scale Modeling of Phase-Domain Transmission Line with Frequency Dependence . . . 41
4.2.1 Fitting of Characteristic Admittance Matrix and Wave Propagation Matrix 42
4.2.2 State-Space Form for Surge Currents . . . 44
4.2.3 State-Space Form for Return Currents . . . 45
4.2.4 Synthesis of Phase-Domain Frequency-Dependent Line Model . . . 47
4.3 Multi-Scale Modeling of Frequency-Dependent Transmission Line Interface for Integrative Simulation of Networks . . . 49
4.3.1 Partitions with Frequency-Dependent Line Interface . . . 49
4.3.2 Equivalent Model of Interface . . . 51
4.3.3 Interface Modeling at EMT-Mode and Phasor-Mode Sides . . . 53
4.3.4 Network Modeling and Construction . . . 57
4.3.5 Flexible Simulation Scheme . . . 58
4.3.6 Selection of Simulation Modes . . . 59
4.4 Test Simulations . . . 60
4.4.1 Transient Recovery Test Network . . . 61
4.4.2 Four-Machine Two-Area System . . . 65
4.4.3 IEEE 39-Bus System . . . 69
4.5 Conclusions . . . 74

5 Multi-Scale Simulation Integrating Nodal Analysis and State-Space Methods 76
5.1 Introduction . . . 76

5.2 Modeling of Interface in Multi-Scale Simulation 77
5.2.1 Reformulation of State-Space Equations with Real Signals 78
5.2.2 Reformulation of State-Space Equations with Analytic Signals 79
5.2.3 Contractual Interfacing Through Frequency-Adaptive Companion Model 82
5.3 Multi-Scale Modeling of PMSG-based Wind Energy Conversion System with State-Space Method 84
5.3.1 State-Space Representation of Generator-Side System 85
5.3.2 State-Space Representation of DC-link Circuit 90
5.3.3 State-Space Representation of Grid-Side System 90
5.3.4 State-State Representation of PMSG-Based WECS 93
5.3.5 Interface Modeling of PMSG-Based WECS 95
5.4 Test Simulations 98
5.4.1 WECS Performance Under Wind Fluctuation 99
5.4.2 Four-Machine Two-Area System 102
5.4.3 IEEE 39-Bus System 106
5.5 Conclusions 110

6 Conclusions **112**
6.1 Contributions 112
6.2 Outlook 114

A Techniques in Multi-Scale Modeling and Simulation **115**
A.1 Interpolation for Multi-Scale Transmission Line Modeling 115
A.2 Automatic Partitioning Based on RDFT 116
A.3 Lagrange Extrapolation 117
A.4 *abc*/*dq* Coordinates Transformation 119
A.5 Phase-Locked Loop 120
A.6 Imaginary Part Construction in Multi-Scale Modeling 120

B Example Data **123**
B.1 3-MW Wind Energy Conversion System 123

B.2 5-MW Wind Energy Conversion System 124

C Terminology **126**

C.1 Symbols 126

C.1.1 Upper Case Letters 126

C.1.2 Lower Case Letters 127

C.1.3 Greek Letters 128

C.1.4 Additional Recurrent Subscripts 129

C.2 Acronyms 130

D Bibliography **132**
