Abstract 3

Zusammenfassung 3

Acknowledgments 7

Chapter 1 - Introduction and Importance of Research

1.1 Introduction 9

1.2 Tehran metropolis as case study 12

1.2.1 Geographical information 12

1.2.2 Climate 12

1.2.3 Conventional cooling systems and urban heat island 17

1.3 Importance of this research 19

1.4 Methodology 21

1.4.1 Sensitivity analysis 21

1.4.2 Building energy model 30

1.4.3 Simulation software 32

1.4.4 Presentation of results 33

1.5 Workflow of this research 34

1.6 Validating the energy model 36

Chapter 2 - Analysis of Input Parameters for Sensitivity Analysis (Tehran Metropolis)

2.1 Introduction 38

2.2 Architectural parameters 39

2.2.1 Floor area of residential units in Tehran 39

2.2.2 Aspect ratio of units 40

2.2.3 Orientation 41

2.3 Conventional construction for building envelope 41

2.3.1 Walls construction material 41

2.3.2 Roof construction material 45

2.3.3 External window 45

2.4 Internal heat gains 47

2.4.1 Internal heat gains through occupants 47

2.4.2 Internal heat gains due to Lighting 51

2.4.3 Internal heat gains through home appliances 53

2.5 Conventional cooling systems 54

2.6 Total efficiency and primary energy factor of generating electricity in Iran 55

2.7 Summary 58

Chapter 3 - Influence of Building Parameters on Energy Demand of Residential Buildings

3.1 Introduction 61

3.2 Methodology 61

3.2.1 Building parameters, their range of variation and probability distribution 61

3.2.2 Creating energy models for simulation 65

3.2.3 Run the created simulation models 65

3.2.4 Collecting the simulation results and carry out the sensitivity analysis 66

3.2.5 Presentation of results 67

3.3 Results and discussion 67

3.3.1 Variation of annual heating and cooling energy demands per floor area due to variation in input parameters 67

3.3.2 Identifying the most influential parameters on annual heating energy demand per floor area 68

3.3.3 Identifying the most influential parameters on annual cooling energy demand per floor area 72

3.4 Summary and conclusions 75

Chapter 4 - Influence of Cooling Systems Performance on Energy and Water Consumption

4.1 Introduction 78

4.2 Evaporative Cooling Systems 79

4.2.1 Direct Evaporative Cooler (DEC) 80

4.2.2 Indirect Evaporative Cooler (IEC) 83

4.2.3 Different combinations and configurations of evaporative cooling systems 85

4.3 Refrigeration systems 86

4.3.1 Mechanical vapor compression refrigeration system 87

4.4 Methodology 89

4.4.1 Input parameters, their range of variation and probability distribution 89

4.4.2 Creating energy models for simulation 94

4.5 Results and discussions 98

4.5.1 Direct Evaporative Cooler (DEC) 99

4.5.2 Other configurations of evaporative cooling and split air conditioning system 106

4.6 Summary and conclusions 115

Chapter 5 - Influence of Occupant Behavior and Control Strategies on Performance of Cooling Systems

5.1 Introduction 120

5.2 Thermal comfort 121
5.2.1 Thermal comfort for mechanically cooled and heated spaces 121
5.2.2 Adaptive thermal comfort theory for buildings without mechanical cooling systems 122
5.3 Occupants behavior 124
5.4 Algorithm for control strategies 126
5.4.1 Algorithm for manual control of windows and cooling systems 126
5.4.2 Algorithm for thermostat control of cooling systems 128
5.5 Methodology 129
5.5.1 Input parameters, their range of variation and probability distribution 129
5.5.2 Creating simulation energy models 130
5.6 Results and discussions 130
5.6.1 Direct Evaporative Cooler, Manual and Thermostat control (M_DEC & T_DEC) 132
5.6.2 Other configurations of evaporative cooling and split air conditioning system 141
5.7 Summary and conclusion 146
Chapter 6 - Influence of Urban Heat Island (UHI) on Performance of Cooling Systems
6.1 Introduction 150
6.2 Urban heat island (UHI) 151
6.2.1 The influence of UHI on urban climate 152
6.2.2 Influence on building energy consumption and indoor comfort 153
6.2.3 Urban heat island in Tehran region 154
6.3 Proposing a model to integrate UHI effect in weather data of Tehran 155
6.3.1 Model for alter in ambiant air temperature due to UHI 156
6.3.2 Model for alter in relative humidity due to UHI 157
6.4 Methodology 158
6.4.1 Input variables, their range of variation and probability distribution 158
6.4.2 Building energy models for simulation 160
6.5 Results and discussions 161
6.5.1 Direct evaporative cooling (DEC) 162
6.5.2 Other configurations of evaporative cooling systems and split unit air conditioner 170
6.6 Summary and conclusions 179
Chapter 7 - Summary, Conclusions and Direction for Future Works
7.1 Summary 184
7.2 Conclusions 186
7.3 Limitations and direction for future work 189
